Criteria #	Good	Strong	Excellent
1	Data available through formal access request procedures with documented application process	Standardized data collection protocols ensuring consistency across sites and timepoints	Mandatory open science policies requiring public data deposition within specified timeframes
2	Basic metadata documentation describing core variables and study design	Well-documented metadata schemas with defined data dictionaries	Rapid data sharing through multiple established platforms
3	Standard file formats enabling broad software compatibility, but lacking comprehensive standardization across all data types	Data sharing through established repositories with defined access procedures	Comprehensive standardized metadata schemas conforming to domain standards
4	—	Adherence to community data standards for at least one major data modality	Integration with established data ecosystems enabling cross-study harmonization
5	—	Frozen standardized analysis sets available to researchers	Extensive publicly accessible data dictionaries and documentation enabling secondary use
6	—	Clear data governance documentation	Proactive outreach and user support facilitating data access
Category Description	Includes resources with functional data sharing mechanisms but limited metadata standards or restricted to single-platform access.	Includes resources with robust infrastructure and metadata but lacking proactive open science mandates.	Examples include resources with enforced data sharing timelines, harmonized data models across multi-site studies, and comprehensive data use documentation.
